User Story #1: As a user, I want to search for jobs based on my interests so that I can find the right job for me.

User Story #2: As a user, I want to be able to find jobs that are close to my home so that I don't have to travel far for work.

User Story #3: As a user, I want to be able to login using SSO so that I don't have to remember another username or password.

Scenario #1:

John is a recent computer science graduate looking for a job that really likes Artificial Intelligence. He decides to use the job searching application to search for work. When he opens the app, It asks him if he would like to log in using his SSO credentials which he opts into. Since John really likes AI, he opens the settings and applies filters for his searches so that it only shows him opportunities that are related to Artificial Intelligence. John also does not want to travel far to go to work so he goes into the application settings and sets his location as well as the distance he's willing to travel for work.

User Story #1: As a user, I want to be notified when new positions open up so that I don't have to actively look for new openings.

User Story #2: As a user, I want to be able to contact the company I am applying for so that I can ask questions about the position they are offering.

User Story #3: As a user, I want to be able to create a profile with all of my credentials so that companies that are scouting could contact me about internship opportunities.

Scenario:

Lily is an undergraduate computer science student looking for an internship. She decides to use the job application to search for internships. After logging in, Lily fills out her skills, interests, and contact information for her profile. She then receives a notification that there is an available internship position so she taps it. After reading the description, Lily contacts the company by using the chat and asks the company questions regarding the internship.
